AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method of producing a lordosis support with a supporting element of plastic of adjustable curvature at rods of a lattice mat, formed by longitudinal and transverse rods, comprising the steps of:

introducing the <u>longitudinal and transverse</u> rods <u>of a lordosis support</u>, and

forming the supporting element of the lordosis support
with an adjustable curvature by the step of embedding the rods in
the supporting element during injection molding of the supporting
element of the lordosis support.

- 2. (Previously Presented) The method of claim 1, wherein the step of embedding includes the step of encapsulating at least some of the rods by molding with the plastic of the supporting element.
- 15. (Previously Presented) The method of claim 1, wherein the step of introducing includes the steps of:

introducing the transverse rods in transverse grooves of the injection mold, and

pushing ends of the transverse rods against a stop which is formed in the injection mold.

16. (Previously Presented) The method of claim 15, further comprising the steps of:

supplying the transverse rods as endless material, and cutting off the transverse rods, when the transverse rods are fixed in contact with the stop in the injection mold, on a side of the injection mold opposite the stop, with one edge of the injection mold being used as cutting edge.

- 17. (Previously Presented) The method of claim 1, wherein the step of introducing includes the step of introducing both the transverse rods as well as the longitudinal rods of the lattice mat into the injection mold and further comprising the step of connecting together the transverse rods and longitudinal rods in the injection mold.
- 18. (Previously Presented) The method of claim 17, wherein the step of introducing includes the step of pushing the longitudinal rods into longitudinal grooves of the injection mold as straight rod endless material.
- 19. (Previously Presented) The method of claims 18, further comprising the step of bending the longitudinal rods in the

injection mold, with a portion of the injection mold functioning as a bending template.

- 20. (Previously Presented) The method of claim 18, further comprising the step of gating plastic parts to the longitudinal rods of the lattice mat.
- 21. (Previously Presented) The method of claim 20, wherein at least some of said plastic parts are casings for connecting regions between the longitudinal rods and the transverse rods.
- 22. (Previously Presented) The method of claim 20, wherein at least some of the plastic parts are anchoring sites for tension springs, which are to be suspended from the longitudinal rods.
- 23. (Previously Presented) The method of claim 20, wherein the plastic parts are injection molded in one step with the supporting element.
- 24. (Previously Presented) The method of claim 17, wherein the step of connecting together includes the step of welding the transverse rods to the longitudinal rods.

- 25. (Previously Presented) The method of claim 17, wherein the step of connecting together includes the step of fastening the transverse rods to the longitudinal rods by bending ends of the transverse rods around the longitudinal rods into one of eyelets and hooks.
- 26. (Currently Amended) A method for producing an initiating element for active head supports of a vehicle seat, for which a functioning part of plastic is fastened to rods of a lattice mat, which is formed by longitudinal and transverse rods, comprising the steps of:

introducing the <u>longitudinal and transverse</u> rods <u>of a</u>

<u>lattice mat</u> into an injection mold for <u>a</u> the functioning part <u>of</u>

<u>an initiating element for an active head support</u>, and

forming the initiating element for the active head support by the step of embedding the rods in the this functioning part during injection molding of the functioning part of the initiating element for the active head support.

27. (New) The method of claim 19, further comprising the step of preventing movement of the bent longitudinal rods before injection molding of the supporting element.
